$$T(z) = -\frac{1}{\alpha'} : \partial X^{\mu} \partial X_{\mu} : , \quad \tilde{T}(\bar{z}) = -\frac{1}{\alpha'} : \bar{\partial} X^{\mu} \bar{\partial} X_{\mu} : , \tag{1}$$

$$V_{k} = :e^{ik \cdot X(z,\bar{z})}:, \quad G_{e,k} = e_{\mu\nu} : \partial X_{z}^{\mu} \, \bar{\partial} X_{\bar{z}}^{\nu} \, e^{ik \cdot X(z,\bar{z})}:, \tag{2}$$

We sometimes use subscripts like ∂X_z^μ to denote variable dependence to avoid clutter.

(a) The weight of a primary operator is given by its OPE with T and \tilde{T} . For exponential operators, there is a neat formula for cross contractions¹:

$$T(z) V_{k}(w, \bar{w}) = \exp\left\{ \int d^{2}z' \int d^{2}w' X_{z'}^{\mu} X_{w'}^{\nu} \frac{\delta}{\delta X_{z'}^{\mu}} \frac{\delta}{\delta X_{w'}^{\nu}} \right\} : T_{z} e^{ik \cdot X_{w}} :$$

$$= \exp\left\{ \int d^{2}z' X_{z'}^{\mu} X_{w}^{\nu} \frac{\delta}{\delta X_{z'}^{\mu}} ik_{\nu} \right\} : T_{z} e^{ik \cdot X_{w}} :$$

$$= : \left\{ \exp\left(ik_{\nu} \int d^{2}z' X_{z'}^{\mu} X_{w}^{\nu} \frac{\delta}{\delta X_{z'}^{\mu}} \right) T_{z} \right\} e^{ik \cdot X_{w}} :$$

$$\sim -\frac{1}{\alpha'} : \left\{ 2\partial_{z} \left(ik_{\sigma} X_{z}^{\mu} X_{w}^{\sigma} \right) \partial_{z} X_{\mu} + \partial_{z} \left(ik_{\rho} X_{z}^{\mu} X_{w}^{\rho} \right) \partial_{z} \left(ik_{\sigma} X_{z,\mu} X_{w}^{\sigma} \right) \right\} e^{ik \cdot X_{w}} :$$

$$\sim -\frac{1}{\alpha'} : \left\{ 2 \left(-\frac{\alpha'}{2} \frac{ik^{\mu}}{z - w} \right) \partial_{z} X_{\mu} + \left(-\frac{\alpha'}{2} \frac{ik^{\mu}}{z - w} \right) \left(-\frac{\alpha'}{2} \frac{ik_{\mu}}{z - w} \right) \right\} e^{ik \cdot X_{w}} :$$

$$\sim \frac{\alpha' k^{2}}{4} \frac{V_{k}(w, \bar{w})}{(z - w)^{2}} + \frac{\partial V_{k}(w, \bar{w})}{z - w}$$

$$(3)$$

Here we've used the result that $ik_{\sigma}X_{z}^{\mu}X_{w}^{\sigma}=ik^{\mu}(-\frac{\alpha'}{2})\ln|z-w|^{2}$. We see that V_{k} is a primary of weight (1,1) iff. $\frac{\alpha'k^{2}}{4}=1$, or $m^{2}=-k^{2}=-\frac{4}{\alpha'}$. This is the mass shell condition for the closed string tachyon (at level 0). On the other hand,

$$G_{e,k} = e_{\mu\nu}G_{k}^{\mu\nu}, \qquad (4)$$

$$T(z) G_{k}^{\mu\nu}(0) \sim :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_{0}^{\nu} e^{ik \cdot X_{0}} : + :T_{z} \partial X_{0}^{\mu} \bar{\partial} X_$$

¹Reference: Polchinski, and physics.stackexchange.com/a/389193.

Therefore, $G_{e,k}$ is a primary of weight (1,1) iff. $1 + \frac{\alpha' k^2}{4} = 1$ and $k^{\mu}e_{\mu\nu} = 0 = k^{\nu}e_{\mu\nu}$. The first equation gives the mass shell condition $m^2 = -k^2 = 0$ for a massless boson, while the second equation constrains the polarization to be transverse. These are the physical constraints for a massless gauge boson, which is the level 1 excitation for a bosonic closed string.

(b) The form of any primary 3-point function is completely fixed by $PSL(2, \mathbb{C})$ invariance². In fact, for any holomorphic $\phi_i(z_i)$ with weight h_i , by translational invariance, we have:

$$\langle \phi_1(z_1) \phi_2(z_2) \phi_3(z_3) \rangle = f(z_{12}, z_{23}, z_{31}), \quad z_{ij} = z_i - z_j,$$
 (7)

Furthermore, scaling invariance requires that f is quasi-homogeneous:

$$z \mapsto z' = \lambda^{-1}z, \quad f \mapsto \left\langle \lambda^{h_1} \phi_1(\lambda z_1) \lambda^{h_2} \phi_2(\lambda z_2) \lambda^{h_3} \phi_3(\lambda z_3) \right\rangle$$
$$= \lambda^{h_1 + h_2 + h_3} f(\lambda z_{12}, \lambda z_{23}, \lambda z_{31})$$
$$= f(z_{12}, z_{23}, z_{31}), \tag{8}$$

$$f = \sum_{a+b+c=\sum_{i}h_{i}} f_{abc} = \sum_{a+b+c=\sum_{i}h_{i}} \frac{C_{abc}}{z_{12}^{a} z_{23}^{b} z_{31}^{c}}$$
(9)

On the other hand, for special conformal transformation $\frac{1}{z} \mapsto \frac{1}{z'} = \frac{1}{z} + a$, we have:

$$z \longmapsto z' = \frac{1}{\frac{1}{z} + \bar{a}} = \frac{z}{1 + z\bar{a}} = w(z), \quad \frac{\partial z}{\partial z'} = \frac{1}{(1 - z\bar{a})^2} = \frac{1}{\kappa^2}, \quad z_{ij} = \frac{z'_{ij}}{\kappa_i \kappa_j},$$
 (10)

$$f \longmapsto f\left(w^{-1}(z_{12}), w^{-1}(z_{23}), w^{-1}(z_{31})\right) \frac{1}{\kappa_1^{2h_1} \kappa_2^{2h_2} \kappa_3^{2h_3}} = f(z_{12}, z_{23}, z_{31}), \tag{11}$$

$$f_{abc}\left(w^{-1}(z_{12}), w^{-1}(z_{23}), w^{-1}(z_{31})\right) = f_{abc}(z_{12}, z_{23}, z_{31}) \kappa_1^{c+a} \kappa_2^{a+b} \kappa_3^{b+c},$$
(12)

We see that f is invariant under special conformal transformation iff. $f = f_{abc}$ where:

$$c + a = 2h_1, \quad a + b = 2h_2, \quad b + c = 2h_3,$$
 (13)

i.e.
$$a = h_1 + h_2 - h_3$$
, $b = h_2 + h_3 - h_1$, $c = h_3 + h_1 - h_2$, (14)

In the above discussions we've restricted ϕ_i to be holomorphic; for *spin-less* $\phi_i = \phi_i(z, \bar{z}), \ h_i = \tilde{h}_i, \ \Delta_i = h_i + \tilde{h}_i$, the holomorphic and anti-holomorphic contributions can be nicely combined, and we have:

$$f = \frac{C}{|z_{12}|^{2a}|z_{23}|^{2b}|z_{31}|^{2c}},\tag{15}$$

$$2a = \Delta_1 + \Delta_2 - \Delta_3, \quad 2b = \Delta_2 + \Delta_3 - \Delta_1, \quad 2c = \Delta_3 + \Delta_1 - \Delta_2,$$
 (16)

$$\langle V_{k_1}(z_1, \bar{z}_1) V_{k_2}(z_2, \bar{z}_2) G_{e,k_3}(z_3, \bar{z}_3) \rangle = \frac{A(k_1, k_2, e)}{|z_{12}|^2 |z_{23}|^2 |z_{31}|^2}$$
(17)

(c) Following the recipe in (a), we have:

$$V_{k_{1}}(z_{1}, \bar{z}_{1}) V_{k_{2}}(z_{2}, \bar{z}_{2}) = : \exp\left(ik_{1,\mu}ik_{2,\nu}X_{1}^{\mu}X_{2}^{\nu}\right) e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} :$$

$$= \exp\left(\frac{\alpha'}{2} k_{1} \cdot k_{2} \ln|z_{12}|^{2}\right) : e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} :$$

$$= |z_{12}|^{\alpha'k_{1}\cdot k_{2}} : e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} :$$
(18)

Apply the on-shell conditions, and we find that:

$$\alpha' k_1 \cdot k_2 = \frac{\alpha'}{2} (k_1 + k_2)^2 - \frac{\alpha'}{2} k_1^2 - \frac{\alpha'}{2} k_2^2 = \frac{\alpha'}{2} (-k_3)^2 - \frac{\alpha'}{2} k_1^2 - \frac{\alpha'}{2} k_2^2 = 0 - 2 - 2 = -4$$
 (19)

We are interested in the $|z_{12}|^{-2}$ term in the OPE around z_2 ; it will contribute to the 3-point function discussed in (b). Note that:

$$:e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}}:=:\left(\cdots+\frac{1}{2}(ik_{1}\cdot X_{1})^{2}+\cdots\right) e^{ik_{2}\cdot X_{2}}:$$

$$=:\left(\cdots-\frac{1}{2}k_{1}^{\mu}k_{1}^{\nu}\left(X_{2}+z_{12}\,\partial X_{2}+\bar{z}_{12}\,\bar{\partial}X_{2}+\cdots\right)_{\mu}\left(\cdots\right)_{\nu}+\cdot\right) e^{ik_{2}\cdot X_{2}}:$$

$$=:\left(\cdots-k_{1,\mu}k_{1,\nu}\left(z_{12}\bar{z}_{12}\,\partial X_{2}^{\mu}\,\bar{\partial}X_{2}^{\nu}\right)+\cdots\right) e^{ik_{2}\cdot X_{2}}:$$

$$=\cdots-|z_{12}|^{2}k_{1,\mu}k_{1,\nu}\,G_{k\gamma}^{\mu\nu}(z_{2},\bar{z}_{2})+\cdots,$$
(20)

$$V_{k_1}(z_1, \bar{z}_1) V_{k_2}(z_2, \bar{z}_2) = \dots + \frac{O_{k_1, k_2}(z_2, \bar{z}_2)}{|z_{12}|^2} + \dots,$$
 (21)

$$O_{k_1,k_2}(z_2,\bar{z}_2) = -k_{1,\rho}k_{1,\sigma}G_{k_2}^{\rho\sigma}(z_2,\bar{z}_2),$$
 (22)

Consider the same limit: $z_1 \rightarrow z_2$ of the 3-point function, and we find that:

$$z_{1} \to z_{2}, \quad \langle V_{k_{1}}(z_{1}, \bar{z}_{1}) \, V_{k_{2}}(z_{2}, \bar{z}_{2}) \, G_{e,k_{3}}(z_{3}, \bar{z}_{3}) \rangle \to \frac{1}{|z_{12}|^{2}} \frac{A(k_{1}, k_{2}, e)}{|z_{23}|^{4}}$$

$$\sim \frac{1}{|z_{12}|^{2}} \langle O_{k_{1}, k_{2}}(z_{2}, \bar{z}_{2}) \, G_{e,k_{3}}(z_{3}, \bar{z}_{3}) \rangle,$$

$$(23)$$

We see that in the $z_2 \to z_3$ limit, we should obtain:

$$O_{k_1,k_2}(z_2,\bar{z}_2)G_{e,k_3}(z_3,\bar{z}_3) = \dots + \frac{A(k_1,k_2,e)}{|z_{23}|^4} + \dots,$$
 (24)

Note that $A(k_1, k_2, e) = A(k_1, k_2, e)$ 1 is simply a number; therefore, when finding $A(k_1, k_2, e)$, it is safe to ignore all (non-identity) operator contributions, as they should cancel each other. Similar to (a), we have:

$$G_{k_{2}}^{\rho\sigma}(z_{2},\bar{z}_{2}) G_{k_{3}}^{\mu\nu}(z_{3},\bar{z}_{3}) = \dots + : \partial X_{2}^{\rho} \bar{\partial} X_{2}^{\sigma} e^{ik_{2} \cdot X_{2}} \partial X_{3}^{\mu} \bar{\partial} X_{3}^{\nu} e^{ik_{3} \cdot X_{3}} : + : \partial X_{2}^{\rho} \bar{\partial} X_{2}^{\sigma} e^{ik_{2} \cdot X_{2}} \partial X_{3}^{\mu} \bar{\partial} X_{3}^{\nu} e^{ik_{3} \cdot X_{3}} : + : \partial X_{2}^{\rho} \bar{\partial} X_{2}^{\sigma} e^{ik_{2} \cdot X_{2}} \partial X_{3}^{\mu} \bar{\partial} X_{3}^{\nu} e^{ik_{3} \cdot X_{3}} : + : \partial X_{2}^{\rho} \bar{\partial} X_{2}^{\sigma} e^{ik_{2} \cdot X_{2}} \partial X_{3}^{\mu} \bar{\partial} X_{3}^{\nu} e^{ik_{3} \cdot X_{3}} :$$

$$(25)$$

$$G_{k_{2}}^{\rho\sigma}(z_{2},\bar{z}_{2}) G_{k_{3}}^{\mu\nu}(z_{3},\bar{z}_{3}) \sim \dots + \left(-\frac{\alpha'}{2}\eta^{\rho\mu}\frac{1}{z_{23}^{2}}\right) \left(-\frac{\alpha'}{2}\eta^{\sigma\nu}\frac{1}{\bar{z}_{23}^{2}}\right) \times 1$$

$$+ \left(-\frac{\alpha'}{2}\eta^{\rho\mu}\frac{1}{z_{23}^{2}}\right) \left(-\frac{\alpha'}{2}\frac{ik_{3}^{\sigma}}{\bar{z}_{23}}\right) \left(-\frac{\alpha'}{2}\frac{ik_{2}^{\nu}}{\bar{z}_{32}}\right) + \left(z \leftrightarrow \bar{z}, \ \rho \leftrightarrow \sigma, \ \mu \leftrightarrow \nu\right)$$

$$+ \left(-\frac{\alpha'}{2}\frac{ik_{2}^{\rho}}{z_{23}}\right) \left(-\frac{\alpha'}{2}\frac{ik_{2}^{\sigma}}{\bar{z}_{23}}\right) \left(-\frac{\alpha'}{2}\frac{ik_{3}^{\mu}}{z_{32}}\right) + \dots$$

$$O_{k_{1},k_{2}}(z_{2},\bar{z}_{2}) G_{k_{3}}^{\mu\nu}(z_{3},\bar{z}_{3}) \sim \dots - k_{1}^{\mu}k_{1}^{\nu} \left(\frac{\alpha'^{2}}{4}\right) \frac{1}{|z_{23}|^{4}}$$

$$- i^{2}(k_{1}^{\mu}k_{2}^{\nu} + k_{1}^{\nu}k_{2}^{\mu}) \left(\frac{\alpha'}{2}(k_{1} \cdot k_{3})\right) \left(\frac{\alpha'^{2}}{4}\right) \frac{1}{|z_{23}|^{4}}$$

$$- i^{4}k_{3}^{\mu}k_{3}^{\nu} \left(\frac{\alpha'}{2}(k_{1} \cdot k_{2})\right)^{2} \left(\frac{\alpha'^{2}}{4}\right) \frac{1}{|z_{23}|^{4}} + \dots$$

$$(26)$$

Again, apply the on-shell conditions, and we find that:

$$\frac{\alpha'}{2}k_{1} \cdot k_{2} = -2, \quad \frac{\alpha'}{2}k_{1} \cdot k_{3} = -\frac{\alpha'}{2}k_{1} \cdot (k_{1} + k_{2}) = -\frac{\alpha'}{2}k_{1}^{2} - \frac{\alpha'}{2}k_{1} \cdot k_{2} = -2 - (-2) = 0,$$

$$A(k_{1}, k_{2}, e) = -\frac{\alpha'^{2}}{4} \left(4\underline{e}_{\mu\nu}k_{3}^{\mu}k_{3}^{\nu} + e_{\mu\nu}k_{1}^{\mu}k_{1}^{\nu}\right) = -\frac{\alpha'^{2}}{4}e_{\mu\nu}k_{1}^{\mu}k_{1}^{\nu}$$

$$= -\frac{\alpha'^{2}}{4}e_{\mu\nu}(k_{2} + k_{3})^{\mu}(k_{2} + k_{3})^{\nu} = -\frac{\alpha'^{2}}{4}e_{\mu\nu}k_{2}^{\mu}k_{2}^{\nu}$$

$$= -\frac{\alpha'^{2}}{8}e_{\mu\nu}\left(k_{1}^{\mu}k_{1}^{\nu} + k_{2}^{\mu}k_{2}^{\nu}\right)$$

$$= -\frac{\alpha'^{2}}{9}e_{\mu\nu}\left(k_{12}^{\mu}k_{12}^{\nu} + (k_{1}^{\mu}k_{2}^{\nu} + k_{1}^{\nu}k_{2}^{\mu})\right),$$
(28)

On the other hand,

$$0 = e_{\mu\nu}k_3^{\mu}k_3^{\nu} = e_{\mu\nu}(k_1 + k_2)^{\mu}(k_1 + k_2)^{\nu} = e_{\mu\nu}\left(k_{12}^{\mu}k_{12}^{\nu} + 2(k_1^{\mu}k_2^{\nu} + k_1^{\nu}k_2^{\mu})\right)$$
(29)

$$A(k_1, k_2, e) = -\frac{\alpha'^2}{8} e_{\mu\nu} k_{12}^{\mu} k_{12}^{\nu} \left(1 - \frac{1}{2} \right) = -\frac{\alpha'^2}{16} e_{\mu\nu} k_{12}^{\mu} k_{12}^{\nu}$$
(30)

2 Strings Scattering Off a Heavy Particle:

A heavy particle can be modeled by some D0-brane with Neumann boundary condition in the X_0 direction⁴. The scattering of a closed string tachyon off the heavy particle can then be computed via a disc diagram with two insertions.

(a) The conformal Killing group (CKG) of the disc is $PSL(2,\mathbb{R})$. It is a 3 dimensional \mathbb{R} Lie group, generated by 3 conformal Killing vectors (CKV's); therefore, it is possible to partially fix the positions of the two insertions V_1, V_2 . On the upper half plane, this can be implemented by putting z_1, z_2 on the imaginary axis, with z_2 fixed and z_1 integrated⁵:

$$\mathcal{A} = g_c^2 e^{-\lambda} \int_0^{z_2} dz_1 \left\langle : c_1^x e^{ik_1 \cdot X_1} : : c_2 \tilde{c}_2 e^{ik_2 \cdot X_2} : \right\rangle, \quad z_2 = i, \quad z_1 = iy, \quad y \in [0, 1]$$
 (31)

⁴Reference: arXiv:hep-th/9611214, arXiv:hep-th/9605168, and *Polchinski*.

⁵Reference: arXiv:0812.4408. I would like to thank Lucy Smith for pointing this out.

Here c^x comes from the CKV that brings $z_1 \to iy$. On the disc this can be taken to be a rotation around z_2 ; when mapped to the upper half plane and at around the imaginary axis, this is simply a translation along the $x = \frac{1}{2}(z + \bar{z})$ direction⁶, i.e.

CKV:
$$\partial_x = \delta_x^a \partial_a \implies \text{Ghost: } c^x,$$
 (32)

$$c^x \partial_x + c^y \partial_y = c^z \partial_z + c^{\bar{z}} \partial_{\bar{z}}, \quad c^x = \frac{1}{2} \left(c^z + c^{\bar{z}} \right) = \frac{1}{2} \left(c(z) + \tilde{c}(\bar{z}) \right), \tag{33}$$

The ghost contribution is then:

$$\langle c_1^x c_2 \tilde{c}_2 \rangle = \langle c^x(z_1) c(z_2) \tilde{c}(\bar{z}_2) \rangle = \frac{1}{2} \Big(\langle c(z_1) c(z_2) \tilde{c}(\bar{z}_2) \rangle + \langle \tilde{c}(z_1) c(z_2) \tilde{c}(\bar{z}_2) \rangle \Big)$$

$$= \frac{1}{2} \Big(\langle c(z_1) c(z_2) c(z_2') \rangle + \langle c(z_1') c(z_2) c(z_2') \rangle \Big), \quad z' = \bar{z},$$

$$= \frac{C_{D^2}^g}{2} (z_{12} z_{12'} z_{22'} + z_{1'2} z_{1'2'} z_{22'}), \quad z_1, z_2 \in i\mathbb{R},$$

$$= 2C_{D^2}^g (z_1^2 - z_2^2) z_2$$

$$(34)$$

On the other hand, the $e^{ik_j \cdot X_j}$ contributions is similar to what we've computed in $\boxed{1}$, except that now we should be careful about the boundary conditions of X^{μ} , which affect the XX contraction in the formulae. For Neumann boundary condition: $\partial_y X^0 = 0$, the half-plane propagator from z' can be constructed with an image at \bar{z}' with the same charge, i.e. we have:

$$\overline{X_1^0 X_2^0} = -\frac{\alpha'}{2} \eta^{00} \ln|z_1 - z_2|^2 - \frac{\alpha'}{2} \eta^{00} \ln|z_1 - \bar{z}_2|^2$$
(35)

While for Dirichlet boundary $X^i = \text{const}$, we can always select the origin so that $X^i = 0$, and in this case the image should have the opposite charge, i.e.

$$\overline{X_1^i X_2^j} = -\frac{\alpha'}{2} \, \delta^{ij} \ln|z_1 - z_2|^2 + \frac{\alpha'}{2} \, \delta^{ij} \ln|z_1 - \bar{z}_2|^2, \tag{36}$$

$$\Rightarrow :e^{ik_{1}\cdot X_{1}} :: e^{ik_{2}\cdot X_{2}} := \exp\left(ik_{1,\mu}ik_{2,\nu}X_{1}^{\mu}X_{2}^{\nu}\right) : e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} :$$

$$= |z_{12}|^{\alpha'k_{1}\cdot k_{2}}|z_{1\bar{2}}|^{\alpha'\left(-k_{1}^{0}k_{2}^{0} - \mathbf{k}_{1}\cdot \mathbf{k}_{2}\right)} : e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} :$$
(37)

Before further calculations, we note that the normal ordering defined here on D^2 differs from that on the usual \mathbb{C}^2 ; in fact, there are also self-contractions with image charge⁷:

$$X^{\mu}(z,\bar{z})X^{\nu}(\bar{z},z) = G_r^{\mu\nu}(z,\bar{z}) = \mp \frac{\alpha'}{2}\eta^{\mu\nu} \ln|z-\bar{z}|^2,$$
 (38)

$$\implies \left\langle :e^{ik_1 \cdot X_1} e^{ik_2 \cdot X_2} : \right\rangle_{D^2} = \left\langle :e^{ik_1 \cdot X_1} e^{ik_2 \cdot X_2} : \right\rangle_{\mathbb{C}^2} \exp\left(\frac{1}{2} \sum_n ik_{n,\mu} ik_{n,\nu} \overrightarrow{X_n^{\mu} X_n^{\nu}}\right), \quad n = 1, 2 \quad (39)$$

The "∓" sign choice depends on the boundary condition.

⁶Reference: *Polchinski*, Chapter 5 & 6.

⁷This is very much similar to the torus situation, where we also have to consider self-contractions with image charges. More rigorous discussion of G^r is given in *Polchinski*.

Therefore,

$$\left\langle :e^{ik_{1}\cdot X_{1}} :: e^{ik_{2}\cdot X_{2}} : \right\rangle_{D^{2}} = \left\langle :e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} : \right\rangle_{\mathbb{C}^{2}} \exp\left(ik_{1,\mu}ik_{2,\nu}X_{1}^{\mu}X_{2}^{\nu}\right) \exp\left(\frac{1}{2}\sum_{n}ik_{n,\mu}ik_{n,\nu}X_{n}^{\mu}X_{n}^{\nu}\right)$$

$$= \left\langle :e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} : \right\rangle_{\mathbb{C}^{2}} \exp\left(\frac{1}{2}\sum_{m,n}ik_{m,\mu}ik_{n,\nu}X_{m}^{\mu}X_{n}^{\nu}\right)$$

$$= \left\langle :e^{ik_{1}\cdot X_{1}} e^{ik_{2}\cdot X_{2}} : \right\rangle_{\mathbb{C}^{2}} |z_{12}|^{\alpha'k_{1}\cdot k_{2}} |z_{1\bar{2}}|^{\alpha'\left(-k_{1}^{0}k_{2}^{0}-\mathbf{k}_{1}\cdot\mathbf{k}_{2}\right)} \prod_{n}|z_{n\bar{n}}|^{\frac{\alpha'}{2}\left(-(k_{n}^{0})^{2}-\mathbf{k}_{n}^{2}\right)}$$

$$(40)$$

Note that X^i has no zero mode due to the Dirichlet boundary, hence $\int \mathcal{D}X$ gives a delta function in only the Neumann direction: $\delta(k_1^0 + k_2^0)$. Physically, this means that only the energy is conversed; the momentum k^i is not conserved since the heavy D0-brane does not recoil. It is therefore convenient to define these on shell variables:

$$s = \omega^{2} = (k_{1}^{0})^{2} = (k_{2}^{0})^{2}, \quad t = -(\mathbf{k}_{1} + \mathbf{k}_{2})^{2} = -\mathbf{k}_{1}^{2} - \mathbf{k}_{2}^{2} - 2\mathbf{k}_{1} \cdot \mathbf{k}_{2} = 2\left(-\omega^{2} - \mathbf{k}_{1} \cdot \mathbf{k}_{2} - \frac{4}{\alpha'}\right), \quad (41)$$

$$\mathbf{k}_{1} \cdot \mathbf{k}_{2} = -\frac{t}{2} - \omega^{2} - \frac{4}{\alpha'}, \quad k_{1} \cdot k_{2} = -\omega(-\omega) + \mathbf{k}_{1} \cdot \mathbf{k}_{2}$$

Here we've used the on-shell condition: $m^2 = -k^2 = \omega^2 - \mathbf{k}^2 = -\frac{4}{\alpha'}$ for tachyons. The previous expressions can then be simplified to:

$$\left\langle :e^{ik_1 \cdot X_1} :: e^{ik_2 \cdot X_2} : \right\rangle_{D^2} = \left\langle :e^{ik_1 \cdot X_1} e^{ik_2 \cdot X_2} : \right\rangle_{\mathbb{C}^2} |z_{12}|^{-\frac{\alpha't}{2} - 4} |z_{1\bar{2}}|^{+\frac{\alpha't}{2} + 4 + 2\alpha'\omega^2} \prod_n |2z_n|^{-\alpha'\omega^2 - 2}$$

$$= iC_{D^2}^X 2\pi \delta(k_1^0 + k_2^0) |z_{12}|^{-\frac{\alpha't}{2} - 4} |z_{1\bar{2}}|^{+\frac{\alpha't}{2} + 4 + 2\alpha'\omega^2} \prod_n |2z_n|^{-\alpha'\omega^2 - 2}$$

$$= iC_{D^2}^X 2\pi \delta(k_1^0 + k_2^0) f(|z_{12}|, |z_{1\bar{2}}|, |z_1|, |z_2|),$$

$$(43)$$

$$\mathcal{A} = g_c^2 \underline{e^{-\lambda}} \cdot i \underline{C_{D^2}^X} \, 2\pi \, \delta \left(k_1^0 + k_2^0 \right) \cdot 2 \underline{C_{D^2}^g} \, \int_0^{z_2} \mathrm{d}z_1 \, \left(z_1^2 - z_2^2 \right) z_2 \, f \left(|z_{12}|, |z_{1\bar{2}}|, |z_1|, |z_2| \right) \\
= g_c^2 \underline{C_{D^2}} \, 2\pi \, \delta \left(k_1^0 + k_2^0 \right) \cdot 2i \, \int_0^1 i \, \mathrm{d}y \, \left((iy)^2 - i^2 \right) i \cdot f \left(1 - y, 1 + y, 2y, 2 \right) \\
= -i g_c^2 C_{D^2} \, 2\pi \, \delta \left(k_1^0 + k_2^0 \right) \cdot 2 \cdot 2^{-2\alpha'\omega^2 - 4} \, \int_0^1 \mathrm{d}y \, (1 - y^2) \, f \left(1 - y, 1 + y, y, 1 \right), \tag{44}$$

$$\int_{0}^{1} dy (1 - y^{2}) f(1 - y, 1 + y, y, 1) = \int_{0}^{1} dy (1 - y)^{-\frac{\alpha't}{2} - 4 + 1} (1 + y)^{+\frac{\alpha't}{2} + 4 + 2\alpha'\omega^{2} + 1} y^{-\alpha'\omega^{2} - 2}
= \int_{0}^{1} dy y^{a-1} (1 - y)^{2b-1} (1 + y)^{-2a-2b+1}, \quad y' = \frac{1 - y}{1 + y},
= -2^{1-2a} \int_{0}^{1} dy' (-y')^{2b-1} (1 - y'^{2})^{a-1}
= 2^{-2a} \int_{0}^{1} d(y'^{2}) (y'^{2})^{b-1} (1 - y'^{2})^{a-1}
= 2^{-2a} B\left(a = -\alpha'\omega^{2} - 1, b = -\frac{\alpha't}{4} - 1\right)$$
(45)

Here $B(a,b) = \frac{\Gamma(a) \, \Gamma(b)}{\Gamma(a+b)}$ is the Euler Beta function.

Putting everything together, we obtain:

$$\mathcal{A} = -ig_c^2 C_{D^2} \, 2\pi \, \delta \left(k_1^0 + k_2^0 \right) \cdot \frac{1}{2} \, B \left(-\alpha' \omega^2 - 1, \, -\frac{\alpha' t}{4} - 1 \right)$$

$$= -ig_c^2 C_{D^2} \, \pi \, \delta \left(k_1^0 + k_2^0 \right) B \left(-\alpha' \omega^2 - 1, \, -\frac{\alpha' t}{4} - 1 \right)$$
(46)

In fact $g_c^2 C_{D^2}$ can be further computed by path integral or by comparing physical results. Here we settle for this generic coefficient since it's already enough for our following discussions⁸.

(b) The Regge limit is found by taking the high energy limit while keeping the momentum transfer fixed; in this case it is achieved by:

Regge:
$$s = \omega^{2} \to \infty$$
, $t = -(\mathbf{k}_{1} + \mathbf{k}_{2})^{2}$ fixed, (47)
$$\mathcal{A} \propto B\left(a = -\alpha' s - 1, b = -\frac{\alpha' t}{4} - 1\right) = \frac{\Gamma(-\alpha' s - 1)}{\Gamma(-\alpha' s - \frac{\alpha' t}{4} - 2)} \Gamma\left(-\frac{\alpha' t}{4} - 1\right)$$

$$\sim \left\{e\left(\alpha' s + \frac{\alpha' t}{4} + 3\right)\right\}^{\frac{\alpha' t}{4} + 1} \Gamma\left(-\frac{\alpha' t}{4} - 1\right)$$

$$\sim \left(e\alpha'\omega^{2}\right)^{\frac{\alpha' t}{4} + 1} \Gamma\left(-\frac{\alpha' t}{4} - 1\right)$$

$$\sim \left(\omega^{2}\right)^{\frac{\alpha' t}{4} + 1} \Gamma\left(-\frac{\alpha' t}{4} - 1\right)$$

Here we've used the Stirling's approximation⁹: $\ln \Gamma(z+1) = \ln z! \sim z \ln z - z$. On the other hand, the hard scattering limit is found by keeping the scattering angle fixed, i.e.

Hard scattering:
$$s = \omega^2 \to \infty$$
, $(t/s) \equiv \lambda$ fixed, (49)

$$\mathcal{A} \propto B(a,b) = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)} \sim \exp\left\{-\alpha' \left(s \ln(\alpha's) + \frac{t}{4} \ln \frac{\alpha't}{4} + \frac{u}{4} \ln \frac{\alpha'u}{4}\right)\right\},\tag{50}$$

$$s = \omega^2 = (k_1^0)^2 = (k_2^0)^2, \quad t = -(\mathbf{k}_1 + \mathbf{k}_2)^2, \quad u = -(\mathbf{k}_1 - \mathbf{k}_2)^2,$$
 (51)

$$s + \frac{t}{4} + \frac{u}{4} = -\frac{4}{\alpha'},\tag{52}$$

Here we've introduced an additional u variable, and we see that the result is symmetric under $t \leftrightarrow u$. We find that under the above limits, the amplitude exhibits similar behaviors as the Veneziano amplitude.

(c) Note that $\Gamma(z)$ has no zeros on \mathbb{C}^2 , therefore the poles of $B(a,b) = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$ is given by the poles of $\Gamma(a)$ and $\Gamma(b)$:

$$a = -\alpha' s - 1 = 0, -1, -2, \dots, \quad b = -\frac{\alpha' t}{4} - 1 = 0, -1, -2, \dots,$$
 (53)

⁸And I have run out of time and energy.

⁹For the validity of Stirling's approximation when $z \in \mathbb{C}$, $\arg z = \pi - \epsilon$ and $|z| \to \infty$, see Wikipedia: Stirling's formula for the gamma function.

The first set of poles gives:

$$\omega^2 = -\frac{1}{\alpha'}, 0, \frac{1}{\alpha'}, \frac{2}{\alpha'}, \dots$$
 (54)

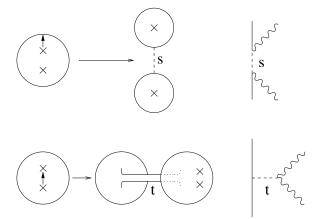

This is precisely the open string spectrum in D=26. Going back to (43) ~ (45), we see that they come from the singularities as $y=|z_1|\to 0$ or $|z_{12}|\to 1$, i.e. the two insertions are far apart.

This is the s-channel contribution; physically, it means that the closed string is first absorbed by the D0-brane, then it propagates as an intermediate open string on the brane, and is re-emitted in the end.

The other set of poles gives:

$$-t = (\mathbf{k}_1 + \mathbf{k}_2)^2 = \frac{4}{\alpha'}, 0, -\frac{4}{\alpha'}, \frac{8}{\alpha'}, \cdots$$
 (55)

Only two poles are realistic due to $\mathbf{k}^2 \geq 0$. This is the *t*-channel contribution, which corresponds to a closed string exchange between the D0-brane and the incoming particle. The above factorization channels are nicely illustrated in the diagram below, borrowed from arXiv:hep-th/9611214.

3 Compton Scattering Between U(N) Gluons and Adjoint Tachyons:

Such scattering is captured by a disc diagram with AATT insertions at the boundary; following the same recipe as before, we write down¹⁰:

$$\mathcal{A} = g_o^{\prime 2} g_o^2 e^{-\lambda} \int dy \left\langle :e_\mu \partial_y X^\mu e^{ik \cdot X}(y) :: c_1^y e_{1,\nu} \partial_y X_1^\nu e^{ik_1 \cdot X_1} :: c_2^y e^{ik_2 \cdot X_2} :: c_3^y e^{ik_2 \cdot X_2} :: \right\rangle$$

$$\times \operatorname{Tr} \left(\lambda^a \lambda^{a_1} \lambda^{a_2} \lambda^{a_3} : \operatorname{in} \left(y, y_1, y_2, y_3 \right) \operatorname{order} \right)$$

$$+ \left(2 \leftrightarrow 3 \right)$$

$$(56)$$

Where $y_i = y_{1,2,3}$ are fixed while $y_0 = y$ is integrated. Note that for 2 we use (x,y) to label the points on the upper half plane so that the boundary coordinate is x = (x,0); here in order to match with Polchinski, we label the boundary points with y = (y,0) instead.

 $^{^{10}\}mathrm{I}$ would like to thank 谷夏 for help with this problem.

We see that \mathcal{A} is structurally similar to the 4-point Veneziano amplitude \mathcal{A}_{TTT} and also the 3-point amplitude \mathcal{A}_{TTA} ; by analogy we can evaluate \mathcal{A} in a similar fashion¹¹:

$$\mathcal{A} = g_o^{\prime 2} g_o^2 e^{-\lambda} \prod_{i < j} |y_{ij}|^{2\alpha' k_i \cdot k_j + 1} e_{\mu} e_{1,\nu}
\times \int dy \prod_j |y_{0j}|^{2\alpha' k \cdot k_j} \left\{ -2\alpha' \frac{\eta^{\mu\nu}}{y_{01}^2} + (-2\alpha') \left(\frac{ik_1^{\mu}}{y_{01}} + \frac{ik_2^{\mu}}{y_{02}} + \frac{ik_3^{\mu}}{y_{03}} \right) (-2\alpha') \left(\frac{ik^{\nu}}{y_{10}} + \frac{ik_2^{\nu}}{y_{12}} + \frac{ik_3^{\nu}}{y_{13}} \right) \right\}
\times \operatorname{Tr}(\dots) i C_{D_2}^X C_{D_2}^g (2\pi)^{26} \delta^{26} \left(\sum_i k_i \right)
+ (2 \leftrightarrow 3)$$
(57)

Notice the doubling due to the boundary contraction $X_1^{\mu}X_2^{\nu} = 2 \times \left(-\frac{\alpha'}{2}\right) \ln y_{12}^2 = -2\alpha' \ln y_{12}$. Further simplifications can be achieved by using the on-shell and physical conditions for open string states:

$$k^2 = k_1^2 = 0, \quad e \cdot k = e_1 \cdot k_1 = 0, \quad k_{2,3}^2 = \frac{1}{\alpha'} = -m^2,$$
 (58)

$$s = -\alpha'(k+k_1)^2 = -2\alpha'k \cdot k_1,$$

$$t = -\alpha'(k+k_2)^2 = -2\alpha'k \cdot k_2 - 1, (59)$$

$$u = -\alpha'(k+k_3)^2 = -2\alpha'k \cdot k_3 - 1,$$

$$s + t + u = -2, (60)$$

$$2\alpha' k_1 \cdot k_2 = \alpha' (k_1 + k_2)^2 - \alpha' k_1^2 - \alpha' k_2^2 = \alpha' (k + k_3)^2 - 1 = -u - 1 = 2\alpha' k \cdot k_3, \tag{61}$$

$$2\alpha' k_1 \cdot k_3 = -t - 1 = 2\alpha' k \cdot k_2,\tag{62}$$

$$2\alpha' k_2 \cdot k_3 = \alpha' (k + k_1)^2 - 2 = -s - 2,\tag{63}$$

$$\mathcal{A} = ig_{o}^{\prime 2}g_{o}^{2}C_{D^{2}}|y_{12}|^{-u}|y_{13}|^{-t}|y_{23}|^{-s-2}e_{\mu}e_{1,\nu}$$

$$\times \int dy|y_{01}|^{-s}|y_{02}|^{-t-1}|y_{03}|^{-u-1}\left\{\frac{\eta^{\mu\nu}}{y_{01}^{2}} - 2\alpha'\left(\frac{ik_{1}^{\mu}}{y_{01}} + \frac{ik_{2}^{\mu}}{y_{02}} + \frac{ik_{3}^{\mu}}{y_{03}}\right)\left(-\frac{ik^{\nu}}{y_{01}} + \frac{ik_{2}^{\nu}}{y_{12}} + \frac{ik_{3}^{\nu}}{y_{13}}\right)\right\}$$

$$\times \operatorname{Tr}(\cdot\cdot\cdot\cdot)(-2\alpha')(2\pi)^{26}\delta^{26}\left(\sum_{i}k_{i}\right)$$

$$+ \left(2 \leftrightarrow 3\right) \tag{64}$$

Fix $y_1 \to \infty$, $y_2 = 0$, $y_3 = 1$, and we get:

$$\mathcal{A} = ig_o^{\prime 2}g_o^2C_{D^2}|y_1|^{-u-t}e_{\mu}e_{1,\nu}
\times \int dy |y_{01}|^{-s}|y_{02}|^{-t-1}|y_{03}|^{-u-1} \left\{ \frac{\eta^{\mu\nu}}{y_{01}^2} - 2\alpha' \left(\frac{ik_1^{\mu}}{y_{01}} + \frac{ik_2^{\mu}}{y_{02}} + \frac{ik_3^{\mu}}{y_{03}} \right) \left(-\frac{ik^{\nu}}{y_{01}} + \frac{ik_2^{\nu}}{y_{12}} + \frac{ik_3^{\nu}}{y_{13}} \right) \right\}
\times \operatorname{Tr}(\cdots) \cdots + \cdots$$
(65)

¹¹For the ∂X contribution, see *Polchinski*, arXiv:1403.4553 and arXiv:1507.02172. Note that there are contractions between two ∂X fields.

$$\mathcal{A} = ig_o^{\prime 2} g_o^2 C_{D^2}$$

$$\times \int dy |y_{02}|^{-t-1} |y_{03}|^{-u-1} \left| \frac{y_1^{s+2}}{y_{01}^s} \right| \left\{ \frac{e \cdot e_1}{y_{01}^s} - 2\alpha' e_\mu \left(\frac{ik_1^\mu}{y_{01}} + \frac{ik_2^\mu}{y_{02}} + \frac{ik_3^\mu}{y_{03}} \right) e_{1,\nu} \left(-\frac{ik^\nu}{y_{01}} + \frac{ik_2^\nu}{y_{12}} + \frac{ik_3^\nu}{y_{13}} \right) \right\}$$

$$\times \operatorname{Tr} \left(\cdots \right) \cdots + \cdots$$

$$= ig_o^{\prime 2} g_o^2 C_{D^2} \int dy \left\{ (e \cdot e_1) f(t, u) - 2\alpha' g(t, u) \right\} \times \dots + \dots$$
(66)

Note that the definition of f(t, u) and g(t, u) contains the Tr (\cdots) factor.

The limit $y_1 \to \infty$ should be treated with care. In fact, the integral along the boundary splits into three ranges¹²:

$$\int dy = \left\{ \int_{y_1 \to -\infty}^{y_3 = 0} + \int_{y_2 = 0}^{y_3 = 1} + \int_{y_3 = 1}^{y_1 \to +\infty} \right\} dy \tag{67}$$

Notice the difference of $y_1 \to \pm \infty$; this is due to the S^1 topology of the boundary. Therefore,

$$\int dy f(t, u) = \int dy |y_{02}|^{-t-1} |y_{03}|^{-u-1} \left| \frac{y_1}{y_{01}} \right|^{s+2} Tr(\cdots), \tag{68}$$

$$\operatorname{Tr}\left(\lambda^{a}\lambda^{a_{1}}\lambda^{a_{2}}\lambda^{a_{3}}\right) \equiv T_{0123},\tag{69}$$

$$\int_{y_{1}\to-\infty}^{y_{2}=0} dy f(t,u) = \int_{y_{1}\to-\infty}^{0} dy (1-y)^{-t-1} (-y)^{-u-1} \left(\frac{-y_{1}}{y-y_{1}}\right)^{s+2} T_{1023} = T_{1023} B(-u, -s-1),$$

$$\int_{y_{3}=1}^{y_{1}\to+\infty} dy f(t,u) = \int_{1}^{y_{1}\to+\infty} dy (y-1)^{-t-1} y^{-u-1} \left(\frac{y_{1}}{y_{1}-y}\right)^{s+2} T_{1230} = T_{1230} B(-t, -s-1),$$

$$\int_{y_{3}=0}^{y_{2}=1} dy f(t,u) = \int_{0}^{1} dy (1-y)^{-t-1} y^{-u-1} t_{1203} = T_{1203} B(-t, -u),$$
(70)

$$\int dy f(t, u) = T_{1203}B(-t, -u) + T_{1230}B(-t, -s - 1) + T_{1023}B(-u, -s - 1)$$
(71)

Under $2 \leftrightarrow 3$, we have $t \leftrightarrow u$; therefore,

$$\int dy f(t, u) + (2 \leftrightarrow 3) = (T_{1203} + T_{1302}) B(-t, -u) + (T_{1230} + T_{1032}) B(-t, -s - 1) + (T_{1023} + T_{1320}) B(-u, -s - 1) \equiv \alpha B(-t, -u) + \beta B(-t, -s - 1) + \gamma B(-u, -s - 1)$$
(72)

 $^{^{12}}$ Reference: *Polchinski*'s discussion of $\mathcal{A}_{TTTT}.$

The g(t,u) factor can be computed in a similar manner. In the end we have ¹³:

$$\mathcal{A} = ig_o^{\prime 2} g_o^2 C_{D^2} (2\pi)^{26} \delta^{26} \left(\sum_i k_i \right) \\
\times (-2\alpha') \left\{ (e_0 \cdot e_1) \left(\alpha B(-t, -u) + \beta B(-t, -s - 1) + \gamma B(-u, -s - 1) \right) \\
+ (-2\alpha') (e_0 \cdot k_2) (e_1 \cdot k_3) \left(\alpha B(-t, -u) - \beta B(-t, -s - 1) - \gamma B(-u, -s - 1) \right) + (2 \leftrightarrow 3) \right\}$$
(73)

 $^{^{13}\}mathrm{Reference}\colon$ arXiv:0801.3358.
